DETAILED ACTION

Response to Amendment

- 1. The amendment filed on 2/1/02 has been received and entered in the case.
- 2. The amendment filed on 2/1/02 is objected to under 35 U.S.C. 132 because it introduces new matter into the disclosure. 35 U.S.C. 132 states that no amendment shall introduce new matter into the disclosure of the invention. The added material which is not supported by the original disclosure is as follows: "the first value being higher than the second value" as discussed below in the 35 U.S.C. 112, 1st paragraph rejection.

Applicant is required to cancel the new matter in the reply to this Office Action.

Claim Rejections - 35 USC § 112

- 3. The following is a quotation of the first paragraph of 35 U.S.C. 112:
 - The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.
- 4. Claim 15 is rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. The recitation "wherein an input impedance of an input stage circuit is set to a first value, and the parasitic capacitance is set to a second value, the first value being higher than the second value" is new matter because "the first value being higher than the second value" is not disclosed in the original specification.
- 5. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Page 2

Art Unit: 2816

6. Claim 15 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

With respect to claim 15, the recitation "wherein an input impedance of an input stage circuit is set to a first value, and the parasitic capacitance is set to a second value, the first value being higher than the second value" is indefinite because no comparison can be made between two things that have two different units. The "parasitic capacitance" has a unit of "farads" while the "input impedance" of a circuit is a complex number which is a combination of resistance, capacitance and inductance. Therefore, the "input impedance" and the "parasitic capacitance" do not have a one-to-one corresponding to each other.

Claim Rejections - 35 USC § 102

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 8. Claims 10-14 and 16-18 are rejected under 35 U.S.C. 102(b) as being anticipated by Bowers (USP 4,675,561).

With respect to claim 10, Figures 6-7 of the Bowers reference disclose a circuit a semiconductor integrated circuit which includes: a pad (62) to which an input signal (Vin) is externally inputted; a source follower circuit (FET2, I2) including a transistor (FET2) having a gate connected to the pad (62) and a source for producing an output signal (72); and it is inherent that a parasitic capacitance (of FET1) is created between said pad and a semiconductor substrate

Art Unit: 2816

(e.g. the parasitic capacitance between the gate and the body of FET1), and said source of the source follower circuit (e.g. source of FET2) is connected to the semiconductor substrate side of the parasitic capacitance (e.g. source of FET2 is connected to the body of FET1) "so as to charge and discharge the parasitic capacitance" (merely intended use) by the output signal of the source follower circuit (72).

With respect to claim 11, it is seen in Figure 7 of the Bowers reference that the semiconductor integrated circuit including an island region (74) on the upper surface of the semiconductor substrate (76) containing impurities of a second conductivity type (P), and a pad (82 or 88) formed on the island region via an oxide film; and wherein the semiconductor substrate contains impurities of a first conductivity type (N); and wherein an output terminal of the source follower circuit is connected to the island region.

With respect to claim 12, it is seen in Figure 7 that the island region (74) is surrounded with an isolation region (76) containing impurities of the first conductivity type (N).

With respect to claim 13, it is seen in the Bowers reference that the first conductivity type is a P-type and the second conductivity type is an N-type (Figure 7 and Col. 5, lines 42-48).

With respect to claim 14, it is seen in Figures 6-7 of the Bowers reference that the output terminal (source of FET2) of the source follower circuit is connected to the island region by way of a metal conductor.

With respect to claim 16, it is seen in Figure 6 that the input stage circuit includes an amplifier (FET2).

Art Unit: 2816

With respect to claim 17, it is seen in Figure 6 that the input stage circuit includes an FET transistor (FET2) integrated on the semiconductor substrate, the FET transistor having a gate connected to the pad.

With respect to claim 18, it is seen in Figure 6 that the FET transistor (FET2) has a drain connected to a power source, and a source connected to the ground via a constant current source (I2) for providing the output signal.

Response to Arguments

9. Applicant's arguments filed on 2/1/02 have been fully considered but they are not persuasive.

Applicant argues that the Bowers fails to teaches or suggests that "a parasitic capacitance is created between said pad and a semiconductor substrate, and said source of the source follower circuit is connected to the semiconductor substrate side of the parasitic capacitance so as to charge and discharge the parasitic capacitance by the output signal of said source follower circuit". However, the "parasitic capacitance" is seen to be inherent (e.g. the parasitic capacitance between the gate and the body of FET1 in Figure 6 of Bowers) because every MOSFET has parasitic capacitances between the body and the gate of the MOSFET (see Weste et al., Figure 4.5, page 184). Also, it is clearly in Figure 6 of the Bowers that the output (72) of the source follower circuit (FET2, I2) is connected to the body (substrate) of FET2 so it implies that the output (72) of the source follower circuit is connected to the substrate side of the parasitic capacitance. Furthermore, the recitation "so as so as to charge and discharge the parasitic capacitance by the output signal of said source follower circuit" is merely intended use and because the output (72) in Figure 6 is connected to the body of FET2 so it implies that the

Art Unit: 2816

output (72) of the source follower circuit charges and discharges that parasitic capacitance of

FET2. Thus, for broad reasonable interpretation, all of the limitations in claim 10 are met

because the structure of the claim is fully met by Bowers.

Conclusion

Because the scope of claim 15 cannot be determined, no prior can be applied against this 10.

claim.

11. The prior art made of record and not relied upon is considered pertinent to applicant's

disclosure.

12. Any inquiry concerning this communication or earlier communications from the

examiner should be directly to Long Nguyen whose telephone number is (703) 308-6063. The

examiner can normally be reached on Monday to Friday from 8:30am to 5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Tim Callahan, can be reached at (703) 308-4876. The fax number for this group is

(703) 308-7722.

Any inquiry of general nature or relating to the status of this application or proceeding

should be directed to the group receptionist whose telephone number is (703) 308-0956.
